

Website Evaluation and Constructive Recommendations

Barangay Health Center Survey Management System

Overall Evaluation

The Barangay Health Center Survey Management System is a functional and easy-to-understand website with a consistent green-and-white design. The system provides separate access for residents and staff/admin, along with features such as surveys, profiles, password management, staff accounts, and reports.

Overall, the website has a good foundation. Most of the improvements needed are not major changes, but small adjustments that could make the system look more polished, balanced, and convenient to use.

1. Website Design and Layout

Evaluation

The website has a consistent color scheme that fits the purpose of a Barangay Health Center. The green color gives the system a clean and professional healthcare feel, and the pages generally follow the same style.

However, some pages, especially the My Profile page, look too plain. The profile form is positioned mostly on the left side, leaving a large amount of empty space on the right. Although the form is readable, the layout could be more balanced and visually appealing. The login page is also very simple. It works, but a first-time visitor is immediately presented with the login choices without much explanation about what the system is for.

Recommendations

- Add a simple welcome or landing page before the login page.
- Briefly explain the purpose of the system and how residents can use it.
- Improve the layout of the Profile page by using the available space more effectively.
- Group related profile information more clearly.
- Consider adding a small logo or health-related visual to give the system more identity.

2. Navigation and Usability

Evaluation

The navigation is generally easy to understand. Important options such as Dashboard, Available Surveys, Profile, Change Password, and Logout are visible and easy to access. The hover effect on the navigation is useful because it shows users that an item is clickable.

However, the yellow highlight feels slightly inconsistent with the green color scheme. The survey completion process is also handled well. After submitting a survey, the user receives confirmation that the response was successfully recorded and can return to the available surveys.

Recommendations

- Keep the current navigation structure because it is simple and easy to follow.
- Make the current/active page visually different from the other navigation items.
- Keep the Back to Available Surveys option after completing a survey.

- Add a Return to Dashboard option after completing a survey.
- A logout confirmation is not necessary because logout is a normal action and does not permanently change user information.

3. Content Quality and Organization

Evaluation

The resident side provides the main information and functions users need, including Dashboard, Available Surveys, Profile, and Change Password. The Reports page is one of the stronger parts of the system. It provides useful functions such as selecting a survey, loading the report, printing or saving it as PDF, and exporting the results to Excel/CSV.

The report is organized clearly. It shows the survey title, reporting period, total respondents, individual questions, response counts, and written suggestions. The tables make the information easy to check. However, the report is mostly text and tables. While this works, staff could understand the results faster if some information were presented visually.

Recommendations

- Group personal information and contact information into logical sections.
- Add a small summary at the top showing important information such as total respondents and average satisfaction.
- Highlight key findings so staff can quickly understand the results.
- Keep the existing PDF and Excel/CSV export functions because they are useful for record keeping and further analysis.
- As the system grows, group related information such as Survey Results and Reports so staff can find related content more easily.
- Use clear headings to separate different types of information and administrative tasks.

4. Functionality and Responsiveness

Evaluation

The website provides functional account-management features such as password changing and account deactivation. The confirmation before deactivating an account is appropriate because it prevents users from accidentally performing an important action. The system also provides feedback after successful actions, which is useful for usability.

The survey completion process works well because users receive confirmation after submitting their answers. The Reports page also supports printing or saving reports as PDF and exporting results to Excel/CSV. One area that could still be improved is protection against repeated incorrect login attempts. The website should also maintain usable functions across different screen sizes.

Recommendations

- Keep confirmation messages for important actions such as account deactivation.
- Keep the existing success notifications because they provide useful feedback.
- Keep the survey submission confirmation because it reassures users that their answers were recorded.
- Keep the existing PDF and Excel/CSV export functions.
- Add temporary login protection after four incorrect password attempts.

- After four failed attempts, temporarily prevent another login attempt and display a message explaining when the user can try again.
- Ensure forms, buttons, reports, and navigation remain usable and readable on different screen sizes.

5. Overall User Experience

Evaluation

The resident side of the website is straightforward and provides the main functions users need. The Dashboard, Available Surveys, Profile, and Change Password pages are clearly separated. The My Profile page is functional, but its UI could be improved. The labels are clear and the fields are easy to understand, but the form looks somewhat basic and occupies only part of the available screen. The large empty area makes the page feel unfinished.

The survey page and completion process provide a stronger user experience because users receive clear feedback after submitting their answers. The staff/admin also provides advanced functions appropriate for staff, including survey reports, staff accounts, resident information, results, and account management. The interface is generally consistent with the resident side, so staff do not have to learn a completely different design.

Recommendations

- Improve the Profile page layout so the form feels more balanced.
- Make the system feel more polished and complete by reducing unnecessary empty space.
- Keep the Save Changes button because it is already clear and easy to find.
- Continue using the existing success notification after profile changes.
- Keep the survey submission confirmation because it reassures users that their answers were recorded.
- Keep the current staff navigation because it is already straightforward.
- Add search or filtering if the number of residents, staff accounts, or survey responses becomes large.
- Keep confirmation messages for important actions while avoiding unnecessary confirmations for simple actions such as logout.
- Make common tasks convenient by providing clear return options after completing a survey.

Overall Recommendations

- Add a welcome/landing page before login to give first-time users some context.
- Improve the My Profile UI, especially the large unused space and basic appearance.
- Add temporary login protection after four incorrect password attempts.
- Keep the existing success notifications, since they are already useful.
- Keep the account deactivation confirmation.
- After submitting a survey, keep Back to Available Surveys and add Return to Dashboard.
- Improve the Reports page with simple charts and summary statistics, while keeping its current reporting and export functions.
- Keep the current staff navigation, but as the system grows, consider grouping related functions such as Survey Results and Reports together to make administrative tasks easier to find.

Final Assessment

Overall, the Barangay Health Center Survey Management System is a good and functional website with a clear purpose. The developers have included the important features needed by both residents and staff, and the system is generally easy to navigate.

The main improvements are focused on making the interface feel more polished rather than changing how the system works. A better welcome page, a more balanced Profile layout, consistent navigation colors, stronger login security, and more visual reports would make the website more complete and user-friendly.
