

Website Recommendations

1. Website Design & Layout

- **Improve the Print Profile layout.** The information on the Print Profile page should be properly aligned into a clean two-column layout. Some fields appear to have uneven spacing or empty areas, so adjusting the CSS grid/flex structure would make the printed profile more organized and professional.
- **Improve the visual hierarchy of the Dashboard cards.** The summary cards currently use very similar colors and visual styling. Consider using different icons, subtle accent colors, or status indicators to help users quickly distinguish important statistics such as residents, children, male/female residents, and other categories.
- **Improve table spacing and alignment.** The Residents table and other data tables should have consistent row height, padding, and alignment. This would make the information easier to scan and give the system a more polished appearance.
- **Add a consistent footer.** A footer containing the barangay/office name, contact information, address, office hours, and possibly a system copyright notice would make the website look more complete and official.
- **Improve responsive design.** The layout should be tested on mobile phones and tablets. The sidebar, dashboard cards, forms, and tables should automatically adjust instead of requiring users to zoom or scroll horizontally.

2. Navigation & Usability

- **Clarify the Dashboard update labels.** "Today's Updates" and "Recent Updates (7 days)" can be confusing because they sound similar. Rename them to something clearer, such as "Updates Today" and "Updates This Week."
- **Consider adding breadcrumbs.** Breadcrumbs such as Dashboard > Residents > Resident Profile would help users understand where they are, especially when navigating through several pages.
- **Improve the resident search function.** Instead of requiring users to select only one search field from a dropdown, consider allowing a general search box that can search by resident number, first name, last name, or other relevant information. Autocomplete suggestions could also make searching faster.
- **Add confirmation dialogs for destructive actions.** Delete buttons should display a confirmation message such as "Are you sure you want to delete this resident?" before permanently removing information. This helps prevent accidental deletion.

3. Content Quality & Organization

- **Make Activity Logs easier to understand.** Instead of displaying generic identifiers such as "User 2 logged in," display the user's actual name together with the activity and timestamp. This would make the audit trail more useful and understandable.
- **Organize the Add Resident form into sections.** The form contains many fields, so grouping them into sections such as **Personal Information, Contact Information, Family Information, and Employment Information** would make it easier to complete.
- **Use consistent labels and terminology.** Make sure the same terms are used throughout the system. For example, if the system uses "Resident Number" in one page, it should not be referred to differently on another page.
- **Provide clearer empty-state messages.** Pages with no records should display helpful messages such as "**No residents found**" or "**No activity records available**" instead of simply showing an empty table or space.

4. Functionality & Security

- **Make the Resident Number read-only for residents.** Since the Resident Number appears to function as an important identifier, residents should not be able to modify it themselves. This can help prevent duplicate records or broken references.
- **Improve staff account management.** The Manage Staff page could include a **Confirm Password** field and clearer information about each staff member's role or access level. Different permissions could be introduced if the system will eventually have multiple types of staff users.
- **Improve password validation.** The Change Password page should enforce the stated password requirements instead of only displaying them. Real-time validation and a password strength indicator would also make the feature easier to use.
- **Add a Show/Hide Password option.** A small eye icon on password fields would make password entry more convenient and reduce typing errors.
- **Add success and error feedback.** After actions such as adding a resident, updating information, changing a password, or deleting a record, the system should display a clear success/error notification so users know whether their action was completed.
- **Add protection against accidental duplicate submissions.** Buttons such as "Add Resident" or "Update Profile" could temporarily disable after being clicked to prevent the same form from being submitted multiple times.

5. Overall User Experience

- **Keep the existing consistent branding.** The blue color scheme, rounded cards, sidebar navigation, and overall design are consistent between the resident and staff sides of the system. This is a strength that should be maintained.
- **Keep the Profile Completion feature.** The **Profile Complete percentage** is a useful UX feature because it gives residents a clear indication of whether their information is complete.
- **Keep the drag-and-drop photo upload.** The photo upload section is user-friendly because it clearly indicates where the user can upload a photo and provides file requirements.
- **Enhance the Activity Logs.** The existing audit trail is a useful feature for a resident information system. Improving the displayed user names, timestamps, and activity descriptions would make it even more effective.
- **Add a notification/alert system.** Important actions such as successful updates, incomplete profiles, failed uploads, or administrative changes could be displayed using clear notification messages.
- **Improve accessibility.** Buttons, form fields, and text should have sufficient contrast and readable font sizes. Form fields should also have clear labels so users can easily understand what information is required.
